

Safer, Painless Breast Screening

Increase your chances-Reduce your risk

Digital Infrared Thermal Imaging

Identify risk factors 5-7 years ahead of traditional methods

Thermal Imaging, as a test of physiology can detect subtle changes in breast temperature that indicate a variety of breast diseases and abnormalities. It measures heat radiating from the body by using an infrared camera connected to a computer.

***No Harmful radiation-No Painful compression
Protects implants from rupture
Appropriate for all women, of all ages
FDA Approved***

***Breast Screening Special \$175
Each Additional Region of Interest +\$50
Upper Body/Women's Health Screening (carotid,
thyroid, head, neck, breast, abdomen & back) \$400
Whole Body Scans \$500***

It takes years for tumors to grow and by the time it shows up on your mammogram it is anywhere from 8-10 years old. Why wait when you can know earlier. DITI detects the vascular changes of the tumor at the 2nd year of its growth. This earlier detection increases your survival rate and improves treatment outcomes. Don't hesitate, your life is at stake here. You have more options than you know, options without risk.
